

Increment and Decrement Operator.

Increment Operators:

Pre Increment ($++a$): Increments the value by 1 and then returns a .

Post Increment ($a++$): Returns the current value of a , then increments a by 1.

These operators have different precedence with Preincrement being evaluated before Post-increment.

Here the Bitwise Operators of AND and XOR is also used.

Algorithm:-

1. Initialize a to 10 and b to 3.
2. Use pre-increment and post increment operators to evaluate expressions.
3. Print the results.
4. Perform the Operations in Bitwise with the d and e to 5.
5. Print the results.
