

Relative Operators:-

Definition:-

There are several relative operators are used to check the given values or variables some of the relative operators are less than, greater than, Equal to, Not equal to. These are those relative operators.

Boolean:- A boolean is a primitive datatype that can have two values true or false and it is used in conditional statements.

Algorithm:-

1. Create the Scanner object.
2. Prompt the user to enter the Input.
3. Read the user's integer for a, using `nextInt()`.
4. Prompt the user to enter an integer for variable b.
5. Read the user's integer input for b, using `nextInt()`.
6. Compare those a and b using Relational Operators and print the result.
