Passing :-

Definition of the Program :-

This Program demonstrates how to Pass a string argument to method in java. the main method initializes a string variable and passes its to the greet method, which then prints the value of the string. The Program illustrates that java uses pass-by-value meaning the method receives a copy of the variable's value rather than a reference to a original variable.

Algorithm :-

1. Start.

2. Initialize a String variable name with the Value "rohith".

3. Call the greet method, Passing name as an argument.

4. Define the greet method :
    Input : a String parameter naam.
    Print the Value of naam.

5. End.

key Points to Note:

Pass by Value: Java Passes the value of the name variable to the greet method. changes to naam in the main method.

Function Call: the greet method is called from the main method with the argument name.
